CSC120H Fall 2018 Worksheet: String Methods

On the back of this page is a help sheet for type str similar to what you will be given on the midterm test. Using that sheet as a reference, answer the following questions.

1. Consider this code

```
wish = 'Happy Birthday'
```

Assuming the code above has been executed, circle the expression(s) that produce 'happy birthday'.

(a) wish[0].lower() + wish[6].lower()

- (b) wish.swapcase()
- (c) wish[0].lower() + wish[1:6] + wish[6].lower() + wish[7:] (d) wish.lower()

2. Consider this code

```
robot = 'R2D2'
```

Assuming the code above has been executed, circle the expression(s) that produce True.

- (a) robot.isupper() (b) robot.isalpha()
- (c) robot.isalnum() (d) robot.isdigit()

3. Consider this code

```
lyrics = '''O Canada!
Our home and native land!
True patriot love in all thy sons command.'''
```

Circle the expression that produces the index of the second exclamation mark.

(a) lyrics.find('!')

- (b) lyrics.find('!').find('!')
- (c) lyrics.find('!', lyrics.find('!')) (d) lyrics.find('!', lyrics.find('!') + 1)

Short Python help descriptions:

```
str:
 x in s --> bool
   Produce True if and only if string x is in string s.
 str(x: object) -> str
   Convert an object into its string representation, if possible.
 S.count(sub: str[, start: int[, end: int]]) -> int
   Return the number of non-overlapping occurrences of substring sub in
   string S[start:end]. Optional arguments start and end are interpreted
   as in slice notation.
  S.find(sub: str[, i: int]) -> int
   Return the lowest index in S (starting at S[i], if i is given) where the
    string sub is found or -1 if sub does not occur in S.
  S.index(sub: str) -> int
   Like find but raises an exception if sub does not occur in S.
  S.isalnum() -> bool
   Return True if and only if all characters in S are alphanumeric
    and there is at least one character in S.
  S.isalpha() -> bool
   Return True if and only if all characters in S are alphabetic
    and there is at least one character in S.
  S.isdigit() -> bool
   Return True if and only if all characters in S are digits
   and there is at least one character in S.
  S.islower() -> bool
   Return True if and only if all cased characters in S are lowercase
    and there is at least one cased character in S.
  S.isupper() -> bool
   Return True if and only if all cased characters in S are uppercase
    and there is at least one cased character in S.
  S.lower() -> str
   Return a copy of the string S converted to lowercase.
  S.lstrip([chars: str]) -> str
   Return a copy of the string S with leading whitespace removed.
    If chars is given and not None, remove characters in chars instead.
  S.replace(old: str, new: str) -> str
   Return a copy of string S with all occurrences of the string old replaced
   with the string new.
  S.rstrip([chars: str]) -> str
   Return a copy of the string S with trailing whitespace removed.
    If chars is given and not None, remove characters in chars instead.
  S.split([sep: str]) -> list of str
   Return a list of the words in S, using string sep as the separator and
   any whitespace string if sep is not specified.
  S.strip([chars: str]) -> str
   Return a copy of S with leading and trailing whitespace removed.
    If chars is given and not None, remove characters in chars instead.
  S.swapcase() -> str
   Return a copy of S with uppercase characters converted to lowercase
    and vice versa.
  S.upper() -> str
    Return a copy of the string S converted to uppercase.
```
