worst case

denote the worst-case complexity for program P with input $x \in I$, where the input size of x is n as $W_P(n) = \max\{t_P(x) \mid x \in I \wedge \text{size}(x) = n\}$

The upper bound $W_P \in \mathcal{O}(U)$ means

$$\exists c \in \mathbb{R}^+, \exists B \in \mathbb{N}, \forall n \in \mathbb{N}, n \geq B$$

$$\Rightarrow \max\{t_P(x) \mid x \in I \wedge \text{size}(x) = n\} \leq cU(n)$$

$$\text{That is: } \exists c \in \mathbb{R}^+, \exists B \in \mathbb{N}, \forall x \in I, \text{size}(x) \geq B$$

$$\Rightarrow t_P(x) \leq cU(\text{size}(x))$$

The lower bound $W_P \in \Omega(L)$ means

$$\exists c \in \mathbb{R}^+, \exists B \in \mathbb{N}, \forall n \in \mathbb{N}, n \geq B$$

$$\Rightarrow \max\{t_P(x) \mid x \in I \wedge \text{size}(x) = n\} \geq cL(n)$$

$$\text{That is: } \exists c \in \mathbb{R}^+, \exists B \in \mathbb{N}, \forall n \in \mathbb{N}, n \geq B$$

$$\Rightarrow \exists x \in I, \text{size}(x) = n \wedge t_P(x) \geq cL(n)$$

bounding a sort

```
def IS(A) :
```

```
    """ IS(A) sorts the elements of A in non-decreasing order """
```

```
1.     i = 1
```

```
2.     while i < len(A) : —  $n-1$  times + 1 loop guard
```

```
3.         t = A[i] —  $n-1$ 
```

```
4.         j = i —  $n-1$ 
```

```
5.         while j > 0 and A[j-1] > t : —  $j = i, i-1, \dots, 1$ 
```

```
6.             A[j] = A[j-1] # shift up —
```

```
7.             j = j-1 —
```

```
8.         A[j] = t —  $n-1$ 
```

```
9.         i = i+1 —  $n-1$ 
```

I want to prove that $W_{IS} \in \mathcal{O}(n^2)$.

big-oh of n^2

We know, or have heard, that all quadratic functions grow at “roughly” the same speed. Here’s how we make “roughly” explicit.

$$\mathcal{O}(n^2) = \{f : \mathbb{N} \mapsto \mathbb{R}^{\geq 0} \mid \underbrace{\exists c \in \mathbb{R}^+}_{\text{mult}} \underbrace{\exists B \in \mathbb{N}}_{\text{break}} \underbrace{\forall n \in \mathbb{N}, n \geq B}_{\text{if } > \text{ break point}} \Rightarrow f(n) \leq cn^2\}$$

$\geq - \infty$

Those are a lot of symbols to process. They say that $\mathcal{O}(n^2)$ is a set of functions that take natural numbers as input and produce non-negative real numbers as output. An additional property of these functions is that for each of them you can find a multiplier c , and a breakpoint B , so that if you go far enough to the right (beyond B) the function is bounded above by cn^2 .

In terms of limits, this says that as n approaches infinity, $f(n)$ is no bigger than cn^2 (once you find the appropriate c).

prove $W_{IS} \in \mathcal{O}(n^2)$ Prove $\exists c \in \mathbb{R}^+, \exists B \in \mathbb{N}, \forall n \in \mathbb{N}, |A|=n \wedge n \geq B \Rightarrow W_{IS}(A) \leq cn^2$

Pick $c = \underline{11}$. Then $c \in \mathbb{R}^+$ # figure out later

Pick $B = \underline{1}$. Then $B \in \mathbb{N}$. # also later.

Assume n is a natural number. # in order to introduce \forall .

Assume $|A|=n \geq B$. # in order to intro \Rightarrow .

Then line 1 contributes ≤ 1 step.

Then lines 2, 3, 4, 8, 9 execute $(n-1)$ times

for $i=1, \dots, n-1 = + \cancel{5} 5(n-1) + 1$ loop guard.

lines 5, 6, 7 contribute $3i+1$ \swarrow loop guard

In Sum, $W_{IS}(A) \leq 1 + \underbrace{5(n-1)}_{\substack{\text{line} \\ 2, 3, 4, 8, 9}} + 1 + \underbrace{(n-1)(3i+1)}_{\substack{\text{loop guard} \\ 5, 6, 7}}$

$$\leq 2 + 5n + n(3i+1).$$

$$\leq n(5 + 3n + 1) + 2$$

$$= 3n^2 + 6n + 2$$

$$\leq 11n^2 \quad \# \text{ since } n \geq 1$$

$$= cn^2 \quad \#$$

prove $W_{\text{IS}} \in \Omega(n^2)$

maximum slice

```
def max_sum(L) :  
    """maximum sum over slices of L"""  
    max = 0  
    i = 0  
    while i < len(L) :  
        j = i + 1  
        while j <= len(L) :  
            sum = 0  
            k = i  
            while k < j :  
                sum = sum + L[k]  
                k = k + 1  
            if sum > max :  
                max = sum  
            j = j + 1  
        i = i + 1  
    return max
```
