Using **Introduction to the Theory of Computation,**
Chapter 7

Outline

formal languages

FSAs

notes

some definitions

alphabet: finite, non-empty set of symbols, e.g. $\{a, b\}$ or $\{0, 1, -1\}$. Conventionally denoted Σ .

string: finite (including empty) sequence of symbols over an alphabet: abba is a string over $\{a, b\}$.

Convention: ε is the empty string, never an allowed symbol, Σ^* is set of all strings over Σ .

language: Subset of Σ^* for some alphabet Σ . Possibly empty, possibly infinite subset. E.g. $\{\}$, $\{aa, aaa, aaaa, \dots\}$.

N.B.: $\{\}$ \neq $\{\varepsilon\}$.

Many problems can be reduced to languages: logical formulas, identifiers for compilation, natural language processing. Key question is recognition:

Given language L and string s , is $s \in L$?

Languages may be described either by descriptive generators (for example, regular expressions) or procedurally (e.g. finite state automata)

more notation

string length: denoted $|s|$, is the number of symbols in s , e.g.
 $|bba| = 3$.

$s = t$: if and only if $|s| = |t|$, and $s_i = t_i$ for $1 \leq i \leq |s|$.

s^R : reversal of s is obtained by reversing symbols of s ,
e.g. $1011^R = 1101$.

st or $s \circ t$: concatenation of s and t — all characters of s
followed by all those of t , e.g. $bba \circ bb = bbabb$.

s^k : denotes s concatenated with itself k times. E.g.,
 $ab^3 = ababab$, $101^0 = \epsilon$.

Σ^n : all strings of length n over Σ , Σ^* denotes all
strings over Σ .

language operations

\bar{L} : Complement of L , i.e. $\Sigma^* - L$. If L is language of strings over $\{0, 1\}$ that start with 0, then \bar{L} is the language of strings that begin with 1 plus the empty string.

$L \cup L'$: union

$L \cap L'$: intersection

$L - L'$: difference

$\text{Rev}(L) = \{s^R : s \in L\}$

concatenation: LL' or $L \cdot L' = \{rt \mid r \in L, t \in L'\}$. Special cases
 $L\{\varepsilon\} = L = \{\varepsilon\}L$, and $L\{\}$ = $\{\}$ = $\{\}L$.

more language operations

exponentiation: L^k is concatenation of L k times. Special case,
 $L^0 = \{\epsilon\}$, including $L = \{\}$!

Kleene star: $L^* = L^0 \cup L^1 \cup L^2 \cup \dots$

states needed to classify a string

what state is a stingy vending machine in based on coins?

accepts only nickles (a), dimes (b), and quarters (c),

no change given, and everything costs 30 cents

useful toy (you'll need JRE)

δ	0	5	10	15	20	25	≥ 30
n	5	10	15	20	25	≥ 30	≥ 30
d	10	15	20	25	≥ 30	≥ 30	≥ 30
q	25	≥ 30	≥ 30	≥ 30	≥ 30	≥ 30	≥ 30

build an automaton with formalities...

quintuple: $(Q, \Sigma, q_0, F, \delta)$

Q is set of states, Σ is finite, non-empty alphabet, q_0 is start state

F is set of accepting states, and $\delta : Q \times \Sigma \mapsto Q$ is transition function

We can extend $\delta : Q \times \Sigma \mapsto Q$ to a transition function that tells us what state a **string** s takes the automaton to:

$$\delta^* : Q \times \Sigma^* \mapsto Q \quad \delta^*(q, s) = \begin{cases} q & \text{if } s = \epsilon \\ \delta(\delta^*(q, s'), a) & \text{if } s' \in \Sigma^*, a \in \Sigma, s = s'a \end{cases}$$

String s is accepted if and only iff $\delta^*(q_0, s) \in F$, it is rejected otherwise.

example — an odd machine

devise a machine that accepts strings over $\{a, b\}$ with an odd number of as

Formal proof requires inductive proof of invariant:

$$\delta^*(E, s) = \begin{cases} E & \text{if } s \text{ has even number of } as \\ O & \text{if } s \text{ has odd number of } as \end{cases}$$

float machine

$$L_1 = \{0, \dots, 9\}$$

$$L_2 = \{+, -\}, L_3 = \{.\}$$

$$L_F = \{s \in L_2^j L_1^m L_3^k L_1^n \mid j, k \leq 1, m, n \geq 1\}$$

Devise a machine that accepts L_F
