Using **Introduction to the Theory of Computation,**
Chapter 2

Outline

power

notes

integer power

```
def power(x, y) :  
1  z = 1  
2  m = 0  
3  while m < y :  
4    z = z * x  
5    m = m + 1  
6  return z
```

$\langle y - m_i \rangle$ is decreasing in \mathbb{N} .

LI $z_i = x^{m_i} \wedge m_i \leq y$
$m_i \in \mathbb{N}$
\mathbb{N} closed
under +.

- ▶ precondition? $x \in \mathbb{R}, y \in \mathbb{N}$
- ▶ postcondition? terminates, returns x^y , $\wedge z = x^y$
- ▶ notation for mutation let z_i and m_i refer to values after i^{th} iteration of loop (at line 3) (loop has iterated i times)

partial correctness

precondition + execution + termination imply postcondition

a loop invariant helps get us closer

$P(i)$ If there is an i th iteration of the loop, then $m_i \leq y \wedge Z_i = X^{m_i}$ + precond satisfied

Claim $\forall i \in \mathbb{N}, P(i)$.

Base case When $i=0$, then $m_i=0, Z_i=1, y \in \mathbb{N}$ by precondition. Then $m_i=0 \leq y \in \mathbb{N}$ and $Z_i=1 = X^{m_i} = X^0 = 1$. So $P(0)$ holds.

Induction Step Assume $i \in \mathbb{N}, P(i)$ holds, and there is an $(i+1)$ th iteration.

Then, since loop condition succeeds, $m_i < y$, so $m_{i+1} \leq y$ ($y \in \mathbb{N}$) $\Rightarrow m_{i+1} \leq y$. Also

$$\begin{aligned} Z_{i+1} &= Z_i * X = X^{m_i} * X \quad (\text{IH}) \\ &= X^{m_{i+1}} = X^{m_{i+1}} \quad (\text{line 5}) \end{aligned}$$

So, $P(i+1)$ holds.

partial correctness

precondition+execution+termination imply postcondition

a loop invariant helps get us closer

Thus, whenever $P(i)$ true + there is an $(i+1)$ th iteration, $P(i+1)$ follows.

Conclude $\forall i \in \mathbb{N}, P(i)$

if precondition is satisfied (+ execution)
+ program terminates

$\Rightarrow \exists$ final index $k. m_k \leq y \wedge z_k = X^{m_k}$ for the
also, since loop terminates $m_k \neq y$

$\Rightarrow m_k = y$ ($m_k \neq y \wedge m_k \leq y$).

$\Rightarrow z_k = X^{m_k} = X^y$

prove partial correctness

← see previous

prove termination

associate a decreasing sequence in \mathbb{N} with loop iterations

it helps to add claims to the loop invariant

Show $\langle y - m_i \rangle$ is strictly decreasing ~~in~~ in \mathbb{N} .

Note $y \in \mathbb{N}, m_i \in \mathbb{N}$ and $m_i \leq y \Rightarrow y - m_i \geq 0$,
so $y - m_i \in \mathbb{N}$.

Claim Assume there is an $(i+1)$ th iteration of the loop. Then $y - m_i > y - m_{i+1}$

Proof If loop iterates ~~to~~ $i+1$ times then
 $m_{i+1} = m_i + 1$, so $y - m_i > y - m_i - 1$
 $= y - (m_i + 1)$
 $= y - m_{i+1}$

Conclude $\langle y - m_i \rangle$ is strictly decreasing in \mathbb{N} . \Rightarrow loop sequence is finite \Rightarrow terminates.

put it together — correctness

pre A is sorted \uparrow , comparable to x , $|A| = n$
 post $0 \leq p \leq n$ $A[0..p-1] < x \leq A[p..n-1]$

LF $A[0..b-1] < x$? $\leq A[e+1..n-1]$

while $b \leq e$
 $m = (b+e) // 2$ # show $b \leq m \leq e$
 if $A[m] < x$:
 $b = m + 1$, else $e = m - 1$

from this, can show -
~~one~~ $b \leq e+1 \leq n$ add this
 to loop.
 in variant.

"derive" conditions from pictures

pre: A is sorted \uparrow , x is comparable to $A[0..n-1]$

$b = 0$
 $e = n - 1$

while $b \leq e$: # LI $A[0..b-1] < x \leq A[e+1..n-1]$

$m = (b+e) // 2$ # integer division

if $A[m] < x$: # $b_i \leq m_{i+1} \leq e_i$
 $b = m + 1$

else:
 $e = \underline{\underline{m - 1}}$

return b

need termination, so
show $\langle e_{i+1} - b_i \rangle$ is in \mathbb{N} and

decreasing $e_{i+1} - b_i \geq e_{i+1} - m_{i+1}$ # since
#

versus $e_{i+1} - (m_{i+1} + 1) \downarrow$

$e_{i+1} - b_i > m_{i+1} - 1 - b_i$ $e_{i+1} - b_i > e_{i+1} - (m_{i+1} + 1)$

do we have termination?

notes
