# review

## ❖ last week

- intro to FSA:
  - useful to **recognize** a language
    - e.g. used in the lexical analyzer
  - and in many other problems that can be encoded to language recognition

## ❖ this week:

- what languages FSAs can recognize?

# FSA formal definition

- ❖ is a 5-tuple  $M = (Q, \Sigma, \delta, q_0, F)$ 
  - $Q$  is the set of states, which is finite & non-empty
  - $\Sigma$  is the alphabet, which is finite & non-empty
  - $\delta : Q \times \Sigma \rightarrow Q$  is the transition function
  - $q_0 \in Q$  is the start state
  - $F \subseteq Q$  is the set of accept states
- ❖  $L(M)$  is a language that machine  $M$  accepts,
  - i.e., set of all strings that machine  $M$  accepts

# Example 86 revisited

- ❖ FSA that only accepts strings with an odd number of  $a$ 's, and any number of  $b$ 's.

$$\Sigma = \{a, b\}$$

## $L(M)$ for Example 86?

❖ set of all strings that  $M$  accepts:

# regular languages

languages that can be recognized by an FSA.

❖ e.g.,

- The language recognized by FSA in **Example 85**:  
*float numbers*.  $\Sigma = \{0..9, +, -, .\}$
- The language recognized by FSA in **Example 83**:  
*simple identifiers*.  $\Sigma = \{a..z, 0..9\}$

# formal definition

❖ let  $\Sigma$  be the alphabet:

- the empty set,  $\emptyset$ , is a RL
- the set  $\{\epsilon\}$  is a RL
- for each  $a \in \Sigma$ , the set  $\{a\}$  is a RL
- If  $L_1$  and  $L_2$  are regular languages, then
  - **union**:  $L_1 \cup L_2$  is RL
  - **concatenation**:  $L_1 \cdot L_2$  is a RL
  - **Kleene star**:  $L_1^*$  is a RL

❖ no other RL over  $\Sigma$  exists.

# example

let  $\Sigma = \{a, b\}$

# notes

Example 83:

Example 84:

# notes

Example 85:

# Example 87: FSA correctness

❖ Revisit Example 86:

- ❖ **FSA<sub>86</sub>** accepts  $L_{86} = \{\omega \in \Sigma^* \mid \omega \text{ has odd \# of } a\text{'s}\}$
- **nothing less, nothing more**

## Example 87:

❖ **FSA<sub>86</sub>** accepts  **$L_{86}$**

❖ **FSA<sub>86</sub>** accepts  **$L_{86} = \{\omega \in \Sigma^* \mid \omega \text{ has odd \# of } a\text{'s}\}$**

- **nothing less, nothing more**

- 

-

## Example 87:

❖  $FSA_{86}$  accepts  $L_{86}$

- to prove it, show that a string  $\omega$  takes (from the beginning) to  $s_1$  **IFF**  $\omega$  has an odd # of a's.
- cannot reach  $s_1$ , without transitions from previous states
- Hence, we must define & **prove a SI for every state**
-

## Example 87:

❖ **FSA<sub>86</sub>** accepts **L<sub>86</sub>**

■ **P( $\omega$ ):**  $\delta^*(s_0, \omega) = \begin{cases} s_0 & \text{only if } \omega \text{ has even \# of } a\text{'s} \\ s_1 & \text{only if } \omega \text{ has odd \# of } a\text{'s} \end{cases}$

❖ prove *SI* for all states holds.

❖ proof by structural induction.

❖ **basis step:**

■

## Example 87:

❖ **FSA<sub>86</sub>** accepts **L<sub>86</sub>**

▪  **$P(\omega)$** :  $\delta^*(s_0, \omega) = \begin{cases} s_0 \\ s_1 \end{cases}$

❖ **inductive step:**

▪

*only if  $\omega$  has even # of  $a$ 's*  
*only if  $\omega$  has odd # of  $a$ 's*

## Example 87:

- case 2:  $y = b$ 
  - left as a practice for you.

# formal definition of RL (revisit)

❖ let  $\Sigma$  be the alphabet:

- the empty set,  $\emptyset$ , is a RL
- the set  $\{\epsilon\}$  is a RL
- for each  $a \in \Sigma$ , the set  $\{a\}$  is a RL
- If  $L_1$  and  $L_2$  are regular languages, then
  - **union**:  $L_1 \cup L_2$  is RL
  - **concatenation**:  $L_1 \cdot L_2$  is a RL
  - **Kleene star**:  $L_1^*$  is a RL

❖ no other RL over  $\Sigma$  exists.

## union (closer look)

Let  $L_{86}$  be set of all strings with an odd number of  $a$ 's, (Example 86)

Let  $L_{88}$  be set of all strings that do not end with  $a$  (Example 88)

❖ Draw the FSA that accepts  $L_{86} \cup L_{88}$  (Example 89)

## union (closer look)

$\Sigma = \{a, b\}$        $q_0 = s_0$   
 $Q = \{s_0, s_1\}$      $F = \{s_1\}$   
 $\delta = \dots$

$\Sigma = \{a, b\}$        $q_0 = t_0$   
 $Q = \{t_0, t_1\}$      $F = \{t_0\}$   
 $\delta = \dots$

❖ Devise FSA<sub>89</sub> that accepts  $L_{86} \cup L_{88}$  (Example 89)

# notes
